 $f2: E \rightarrow \text{in} \mid \text{out} \text{ chf } F$
 $f2(e) \equiv \mathcal{E}_{f2}(e)$
 $f3: \text{Unit} \rightarrow \text{in} \text{ chf } \text{out} \text{ chg } \text{Unit}$
 \dots
axiom
 $\mathcal{P}_i(f1, va),$
 $\mathcal{P}_j(f2, vb),$
 \dots
 $\mathcal{P}_k(f3, ve)$

A.8. Simple RSL Specifications

- Besides the above constructs RSL also possesses module-oriented
 - scheme,
 - class and
 - object
 constructs.
- We shall not cover these here.
- An RSL specification is then simply
 - a sequence of one or more clusters of
 - * zero, one or more sort and/or type definitions,
 - * zero, one or more variable declarations,
 - * zero, one or more channel declarations,
 - * zero, one or more value definitions (including functions) and
 - * zero, one or more and axioms.
- We can illustrate these specification components schematically:

- The ordering of these clauses is immaterial.
- Intuitively the meaning of these definitions and declarations are the following.
 - The **type** clause introduces a number of user-defined type names;
 - * the type names are visible anywhere in the specification;
 - * and either denote sorts or concrete types.
 - The **variable** clause declares some variable names;
 - * a variable name denote some value of decalred type;
 - * the variable names are visible anywhere in the specification:
 - assigned to ('written') or
 - values 'read'.
 - The **channel** clause declares some channel names;
 - * either simple channels or arrays of channels of some type;
 - * the channel names are visible anywhere in the specification.

(A. A.8. **Simple RSL Specifications**)

- The **value** clause bind (constant) values to value names.
 - * These value names are visible anywhere in the specification.
 - * The specification

type	value
A	a:A

- * non-deterministically binds **a** to a value of type **A**.
- * Thus includes, for example

type	value
A, B	f: A → B

- * which non-deterministically binds **f** to a function value of type **A→B**.

(A. A.8. **Simple RSL Specifications**)

Example 49 – A Neat Little “System”:

- We present a self-contained specification of a simple system:
 - The system models
 - * vehicles moving along a net, *vehicle*,
 - * the recording of vehicles entering links, *enter_sensor*,
 - * the recording of vehicles leaving links, *leave_sensor*, and
 - * the *road_pricing payment* of a vehicle having traversed (*entered* and *left*) a link.
 - Note
 - * that vehicles only pay when completing a link traversal;
 - * that ‘road pricing’ only commences once a vehicle enters the first link after possibly having left an earlier link (and hub); and
 - * that no *road_pricing payment* is imposed on vehicles entering, staying-in (or at) and leaving hubs.

(A. A.8. **Simple RSL Specifications**)

- The **axiom** clause is usually expressed as several “comma (,) separated” predicates:

$$\mathcal{P}_i(\overline{A_i}, \overline{f_i}, \overline{v_i}), \mathcal{P}_j(\overline{A_j}, \overline{f_j}, \overline{v_j}), \dots, \mathcal{P}_k(\overline{A_k}, \overline{f_k}, \overline{v_k})$$

- where $(\overline{A_k}, \overline{f_k}, \overline{v_k})$ is an abbreviation for $A_{\ell_1}, A_{\ell_2}, \dots, A_t, f_{\ell_1}, f_{\ell_2}, \dots, f_{\ell_f}, v_{\ell_1}, v_{\ell_2}, \dots, v_{\ell_v}$.
- The indexed sort or type names, A and the indexed function names, d , are defined elsewhere in the specification.
- The index value names, v are usually names of bound ‘variables’ of universally or existentially quantified predicates of the indexed (“comma”-separated) \mathcal{P} .

(A. A.8. **Simple RSL Specifications**)

- We assume the following:
 - * that each *link* is somehow associated with two pairs of *sensors*:
 - a pair of *enter* and *leave sensors* at one end, and
 - a pair of *enter* and *leave sensors* at the other end;
 and
 - * a *road pricing* process
 - which records pairs of link enterings and leavings,
 - first one, then, after any time interval, the other,
 - with leavings leading to debiting of traversal fees;
- Our first specification
 - define types, – declares channels and
 - assume a net value, – state signatures of all processes.

(A. A.8. Simple RSL Specifications)

- *ves* stand for vehicle entering (link) sensor channels,
- *vls* stand for vehicle leaving (link) sensor channels,
- *rp* stand for ‘road pricing’ channel
- *enter_sensor(hi,li)* stand for vehicle entering [sensor] process from hub *hi* to link (*li*).
- *leave_sensor(li,hi)* stand for vehicle leaving [sensor] process from link *li* to hub (*hi*).
- *road_pricing()* stand for the unique ‘road pricing’ process.
- *vehicle(vi)(...)* stand for the vehicle *vi* process.

(A. A.8. Simple RSL Specifications)

- To understand the sensor behaviours let us review the vehicle behaviour.
- In the *vehicle* behaviour defined in Example 48, in two parts, Slide 297 and Slide 299 we focus on the events
 - [7] where the vehicle enters a link, respectively
 - [5'] where the vehicle leaves a link.
- These are summarised in the schematic reproduction of the vehicle behaviour description.
 - We redirect the interactions between vehicles and links to become
 - interactions between vehicles and enter and leave sensors.

value

$\delta:\text{Real} = \text{move}(h,f)$ axiom $0 < \delta \ll 1$
 $\text{move}: H \times F \rightarrow F$

© Dines Bjørner 2010, Fredsvej 11, DK-2840 Holte, Denmark

- As mentioned on Slide 306 *link* behaviours are associated with two pairs of sensors:
 - a pair of *enter* and *leave sensors* at one end, and
 - a pair of *enter* and *leave sensors* at the other end;

value

```

link(li)(l) ≡
  let {hi,hi'} = ωHls(l) in
    enter_sensor(hi,li) || leave_sensor(li,hi) ||
    enter_sensor(hi',li) || leave_sensor(li,hi') end
enter_sensor(hi,li) ≡
  let vi = ves[hi,li]? in rp!μEnter_LL(vi,li); enter_sensor(hi,li) end
leave_sensor(li,hi) ≡
  let vi = ves[li,hi]? in rp!μLeave_LL(vi,li); enter_sensor(li,hi) end

```

```

road_pricing(lvs,fee,acc) ≡ in rp
  let m = rp? in
    case m of
      μEnter_LL(vi,li) →
        road_pricing(lvs†[li→lvs(li)∪{vi}],fee,acc),
      μLeave_LL(vi,li) →
        let lvs' = if vi ∈ lvs(li) then lvs†[li→lvs(li)\{vi}] else lvs end,
            acc' = payment(vi,li)(fee,acc) in
          road_pricing(lvs',fee,acc')
    end end end

```

■ End of Example 49

- The *LVS* component of the *road_pricing* behaviour serves,
 - among other purposes that are not mentioned here,
 - to record whether the movement of a vehicles “originates” along a link or not.
- Otherwise we leave it to the student to carefully read the formulas.

value

```

payment: VI × LI → (ACC × FEE) → ACC
payment(vi,li)(fee,acc) ≡
  let bal' = if vi ∈ dom acc then add(acc(vi),fee(li)) else fee(li) end
  in acc † [vi ↦ bal'] end
add: Fee × Bal → Bal [add fee to balance]

```

End of Lecture 11: RSL SPECIFICATIONS
