## Assignment 1 Advanced Functional Programming Topics: Higher-order functions Issued on: 03/12/2009, due date: 03/26/2009

For this assignment a Haskell script named AssFFP1.hs shall be written offering functions which solve the problems described below. This file AssFFP1.hs shall be stored in your home directory, as usual on the top most level. Comment your programs meaningfully. Use constants and auxiliary functions, where appropriate.

• Higher-order functions such as map, filter, and foldl demonstrate the usefulness of allowing functions as arguments of other functions. As an exercise we here want to extend our portfolio of higher-order functions by a few additional instances allowing us in the future to conveniently deal with various variants of iteration.

To this end, develop higher-order Haskell functions for, while, repeat, and loop with the signatures

- for :: (a -> a) -> Int -> a -> a
- while :: (a -> Bool) -> (a -> a) -> a -> a
- repeat :: (a -> a) -> (a -> Bool) -> a -> a
- loop :: (a -> a) -> (a -> Bool) -> (a -> a) -> a -> a

which shall be defined as follows:

- Applied to arguments f, n, and z, the expression for f n z shall evaluate to f<sup>n</sup>(z), if n is positive; otherwise to z.
- Applied to arguments b, f, and z, the expression while b f z evaluates to z, if b z evaluates to False; otherwise to while b f (f z).
- Applied to arguments f, b, and z, the expression repeat f b z evaluates to f z, if (b . f) z evaluates to True; otherwise to repeat f b (f z).
- Applied to arguments f, b, g and z, the expression loop f b g z evaluates to f z, if (b . f) z evaluates to True; otherwise to loop f b g ((g . f) z).

Think about if you can reuse a function to implement some of the other ones!
