8.10.2009

# Overview

1. Motivation
2. Reached goals
3. Technical details
4. Conclusion and Future Work

# Motivation

Proofing a program logic sound and complete is not a new idea.

Then why do it?

- ▶ Preparation for modular program logic
- ▶ We want to have a *usable* logic

# Reached goals

Definitions:

- ▶ AST of Java Subset *Java-KE*
- ▶ Notion of welltyped states and a big-step semantic
- ▶ Logic rules

# Reached goals

Theorems:

- ▶ Type safety of *Java-KE*:

$$S :: pp \rightarrow SQ \wedge pp\_in\_prog \ pp \Rightarrow wtr \ SQ \ pp$$

- ▶ Soundness of the logic rules:

$$\begin{aligned} & A \vdash \{P\}pp\{Q\} \wedge pp\_in\_prog \ pp \\ \Rightarrow & \forall N. ((\forall tr \in A. tr\_rsem \ tr \ N \wedge \\ & \forall LS \ SQ. P \ LS \wedge S :: pp - N \rightarrow SQ) \Rightarrow Q \ L \ SQ) \end{aligned}$$

Definitions and theorems all in Isabelle/HOL

## Old invocation rule

$$\begin{array}{c} \Gamma, A \vdash \{\text{Normal } P\} \quad \forall a. \Gamma, A \vdash \{Q \leftarrow \text{val } a\} \text{args} \Rightarrow \{R \ a\} \\ \quad \forall a \text{ vs } D \ I. \Gamma, A \vdash \{(R \ a \leftarrow \text{Vals } \text{vs} \wedge . \\ \quad (\lambda(x, s). D = \text{target } \text{mode } s \ a \ \text{md} \wedge I = \text{locals } s); . \\ \quad \text{init\_lvars } \Gamma D(mn, pTs) \text{mode } a \ \text{vs}) \wedge . \\ \quad (\lambda\sigma. \text{normal } \sigma \longrightarrow \Gamma \vdash \text{mode} \rightarrow D \preceq t)\} \\ \quad \text{Methd } D(mn, pTs) - \succ \{\text{set\_lvars } I.; S\} \end{array}$$

---

$$\Gamma, A \vdash \{\text{Normal } P\} \{t, \text{md}, \text{mode}\} e..mn(\{pTs\} \text{args}) - \succ \{S\}$$

## New invocation rule

$$\frac{\text{styp}_v([n]_x := y.m(e)) \ y = \text{Some}(\text{RefT } \text{rid})}{A \vdash \{P\} \text{VirMeth } m \ \text{rid} \{Q\}}$$
$$A \vdash \{(\lambda L S. S[y]_v \neq \text{Null} \wedge \\ P \ L(S[\text{this} \leftarrow S[y]_v]_v[\text{par} \leftarrow S[e]_e]_v))\} \\ \text{Stmnt}([n]_x := y.m(e)) \ \{Q[x/\text{res}]_{ww}\}$$

# Static types

Every statement in our AST is unique.

We can get the static type of a variable just by supplying the relevant statement.

Example:

$$\text{stypv}([n]x = y.m(e)) \ y = \text{RefT Object}$$

# Conclusion and Future Work

## Conclusion

- ▶ Usable logic rules are possible
- ▶ There is room for improvement

## Future Work

- ▶ Completeness is missing
