(A. An RSL Primer A.1. Types A.1.1. Type Expressions A.1.1.1. Atomic Types)

type[1] **Bool**[2] **Int**[3] **Nat**[4] **Real**[5] **Char**[6] **Text**

1. The Boolean type of truth values **false** and **true**.
2. The integer type on integers ..., -2, -1, 0, 1, 2,
3. The natural number type of positive integer values 0, 1, 2, ...
4. The real number type of real values, i.e., values whose numerals can be written as an integer, followed by a period (“.”), followed by a natural number (the fraction).
5. The character type of character values “a”, “b”, ...
6. The text type of character string values “aa”, “aaa”, ..., “abc”, ...

A. An RSL Primer**A.1. Types****A.1.1. Type Expressions**

- Type expressions are expressions whose value are type, that is,
- possibly infinite sets of values (of “that” type).

A.1.1.1. Atomic Types

- Atomic types have (atomic) values.
- That is, values which we consider to have no proper constituent (sub-)values,
- i.e., cannot, to us, be meaningfully “taken apart”.

March 2, 2010, 16:48, Vienna Lectures, April 2010

(A. An RSL Primer A.1. Types A.1.1. Type Expressions A.1.1.1. Atomic Types)

Example 28 – Basic Net Attributes:

- For safe, uncluttered traffic, hubs and links can ‘carry’ a maximum of vehicles.
- Links have lengths. (We ignore hub (traversal) lengths.)
- One can calculate whether a link is a two-way link.

March 2, 2010, 16:48, Vienna Lectures, April 2010

© Dines Bjørner 2010, Fredsvej 11, DK-2840 Holte, Denmark

type

MAX = Nat

LEN = Real

is_Two_Way_Link = Bool

value

ω Max: $(H|L) \rightarrow \text{MAX}$

ω Len: $L \rightarrow \text{LEN}$

is_two_way_link: $L \rightarrow \text{is_Two_Way_Link}$

is_two_way_link(l) $\equiv \exists \sigma:L\Sigma \cdot \sigma \in \omega H\Sigma(l) \wedge \text{card } \sigma=2$

■ End of Example 28

Example 29 – Composite Net Type Expressions:

- The type clauses of function signatures:

value

f: $A \rightarrow B$

- often have the type expressions A and/or B
- be composite type expressions:

A.1.1.2. Composite Types

- Composite types have composite values.
- That is, values which we consider to have proper constituent (sub-)values,
- i.e., can, to us, be meaningfully “taken apart”.

[7] A-set

[8] A-infset

[9] $A \times B \times \dots \times C$

[10] A^*

[11] A^ω

[12] $A \overset{m}{\rightarrow} B$

[13] $A \rightarrow B$

[14] $A \overset{\sim}{\rightarrow} B$

[15] (A)

[16] $A | B | \dots | C$

[17] $\text{mk_id}(\text{sel_a:A}, \dots, \text{sel_b:B})$

[18] $\text{sel_a:A} \dots \text{sel_b:B}$

value

ω HIs: $L \rightarrow \text{HI-set}$

Example 1 Item [5]

ω LIs: $H \rightarrow \text{LI-set}$

Example 1 Item [6]

$\omega H\Sigma$: $H \rightarrow \text{HT-set}$

Example 1 Item [10]

set_HΣ: $H \times H\Sigma \rightarrow H$

Example 2 Item [12]

- Right-hand sides of type definitions often have composite type expressions:

type

$N = \text{H-set} \times \text{L-set}$

$\text{HT} = \text{LI} \times \text{HI} \times \text{LI}$

$\text{LT}' = \text{HI} \times \text{LI} \times \text{HI}$

Example 1 Item [2]

Example 1 Item [9]

Example 7 Item [32]

■ End of Example 29

Example 30 – Composite Net Types:

- There are many ways in which nets can be concretely modelled:
- **Sorts + Observers + Axioms:** First we show an example of type definitions without right-hand side, that is, of sort definitions.

From a net one can observe many things.

Of the things we focus on are the hubs and the links.

A net contains two or more hubs and one or more links.

A.1.2. Type Definitions

A.1.2.1. Concrete Types

- Types can be concrete
- in which case the structure of the type is specified by type expressions:

type

$A = \text{Type_expr}$

type

[sorts] $N_\alpha, H, L, \text{HI}, \text{LI}$

value

$\omega\text{Hs}: N_\alpha \rightarrow \text{H-set}$

$\omega\text{Ls}: N_\alpha \rightarrow \text{L-set}$

axiom

$\forall n: N_\alpha \cdot \text{card } \omega\text{Hs}(n) \geq 2 \wedge \text{card } \omega\text{Ls}(n) \geq 1 \wedge \dots$

(A. An RSL Primer A.1. Types A.1.2. Type Definitions A.1.2.1. Concrete Types)

- **Cartesians + Wellformedness:** A net can be considered as a Cartesian of sets of two or more hubs and sets of one or more links.

type

[sorts] H, L

 $N_\beta = \text{H-set} \times \text{L-set}$ **value** $\text{wf_}N_\beta: N_\beta \rightarrow \text{Bool}$ $\text{wf_}N_\beta(\text{hs}, \text{ls}) \equiv \text{card } \text{hs} \geq 2 \wedge \text{card } \text{ls} \geq 1 \dots$ $\text{inject_}N_\beta: N_\alpha \xrightarrow{\sim} N_\beta \text{ pre: wf_}N_\beta(\text{hs}, \text{ls})$ $\text{inject_}N_\beta(n_\alpha) \equiv (\omega \text{Hs}(n_\alpha), \omega \text{Ls}(n_\alpha))$

(A. An RSL Primer A.1. Types A.1.2. Type Definitions A.1.2.1. Concrete Types)

type

[sorts] H, HI, L, LI

 $N_\gamma = \text{HUBS} \times \text{LINKS} \times \text{GRAPH}$ [a] $\text{HUBS} = \text{HI} \xrightarrow{\text{m}} \text{H}$ [b] $\text{LINKS} = \text{LI} \xrightarrow{\text{m}} \text{L}$ [c] $\text{GRAPH} = \text{HI} \xrightarrow{\text{m}} (\text{LI} \text{ --m> HI})$

- [a,b] $\text{hs}:\text{HUBS}$ and $\text{ls}:\text{LINKS}$ are maps from hub (link) identifiers to hubs (links) where one can still observe these identifiers from these hubs (link).

- Example 39 on page 233 defines the well-formedness predicates for the above map types.

■ End of Example 30

(A. An RSL Primer A.1. Types A.1.2. Type Definitions A.1.2.1. Concrete Types)

- **Cartesians + Maps + Wellformedness:** Or a net can be modelled as a triple of

- hubs (modelled as a map from hub identifiers to hubs),
- links (modelled as a map from link identifiers to links), and
- a graph from hub h_i identifiers h_{i_i} to maps from identifiers l_{i_j} of hub h_i connected links l_{i_j} to the identifiers h_{j_i} of link connected hubs h_j .

(A. An RSL Primer A.1. Types A.1.2. Type Definitions A.1.2.1. Concrete Types)

- Schematic type definitions:

- [1] $\text{Type_name} = \text{Type_expr} \text{ /* without |s or subtypes */}$
- [2] $\text{Type_name} = \text{Type_expr}_1 \mid \text{Type_expr}_2 \mid \dots \mid \text{Type_expr}_n$
- [3] $\text{Type_name} ==$
 $\text{mk_id}_1(\text{s_a1}:\text{Type_name_a1}, \dots, \text{s_ai}:\text{Type_name_ai}) \mid$
 $\dots \mid$
 $\text{mk_id}_n(\text{s_z1}:\text{Type_name_z1}, \dots, \text{s_zk}:\text{Type_name_zk})$
- [4] $\text{Type_name} :: \text{sel_a}:\text{Type_name_a} \dots \text{sel_z}:\text{Type_name_z}$
- [5] $\text{Type_name} = \{ \mid \text{v}:\text{Type_name}' \cdot \mathcal{P}(\text{v}) \mid \}$

(A. An RSL Primer A.1. Types A.1.2. Type Definitions A.1.2.1. Concrete Types)

- where a form of [2–3] is provided by combining the types:

$$\begin{aligned} \text{Type_name} &= A \mid B \mid \dots \mid Z \\ A &== \text{mk_id_1}(s_{a1}:A_1, \dots, s_{ai}:A_i) \\ B &== \text{mk_id_2}(s_{b1}:B_1, \dots, s_{bj}:B_j) \\ &\dots \\ Z &== \text{mk_id_n}(s_{z1}:Z_1, \dots, s_{zk}:Z_k) \end{aligned}$$

axiom

$$\begin{aligned} &\forall a1:A_1, a2:A_2, \dots, ai:A_i \cdot \\ &\quad s_{a1}(\text{mk_id_1}(a1, a2, \dots, ai)) = a1 \wedge s_{a2}(\text{mk_id_1}(a1, a2, \dots, ai)) = a2 \wedge \\ &\quad \dots \wedge s_{ai}(\text{mk_id_1}(a1, a2, \dots, ai)) = ai \wedge \\ &\forall a:A \cdot \mathbf{let} \text{mk_id_1}(a1', a2', \dots, ai') = a \mathbf{in} \\ &\quad a1' = s_{a1}(a) \wedge a2' = s_{a2}(a) \wedge \dots \wedge ai' = s_{ai}(a) \mathbf{end} \end{aligned}$$

March 2, 2010, 16:48, Vienna Lectures, April 2010

© Dines Bjørner 2010, Fredsvej 11, DK-2840 Holte, Denmark

(A. An RSL Primer A.1. Types A.1.2. Type Definitions A.1.2.1. Concrete Types)

type

$$\begin{aligned} 7 \quad \text{Insert} &== \text{Ins}(s_{\text{ins}}:\text{Ins}) \\ 7 \quad \text{Ins} &= 2x\text{Hubs} \mid 1x1nH \mid 2nHs \\ 7(a) \quad 2x\text{Hubs} &== 2\text{oldH}(s_{hi1}:H1, s_l:L, s_{hi2}:H1) \\ 7(b) \quad 1x1nH &== 1\text{oldH}1\text{newH}(s_{hi}:H1, s_l:L, s_{h}:H) \\ 7(c) \quad 2nHs &== 2\text{newH}(s_{h1}:H, s_l:L, s_{h2}:H) \\ 8 \quad \text{Remove} &== \text{Rmv}(s_{li}:L1) \end{aligned}$$

axiom

$$\begin{aligned} 7(d) \quad &\forall 2\text{oldH}(h', l, h''): \text{Ins} \cdot h' \neq h'' \wedge \text{obs_LIs}(l) = \{h', h''\} \wedge \\ &\quad \forall 1\text{old}1\text{newH}(h, l, h): \text{Ins} \cdot \text{obs_LIs}(l) = \{h, \text{obs_HI}(h)\} \wedge \\ &\quad \forall 2\text{newH}(h', l, h''): \text{Ins} \cdot \text{obs_LIs}(l) = \{\text{obs_HI}(h'), \text{obs_HI}(h'')\} \end{aligned}$$

Example ?? on page ?? presents the semantics functions for *int_Insert* and *int_Remove*. ■ End of Example 31

March 2, 2010, 16:48, Vienna Lectures, April 2010

© Dines Bjørner 2010, Fredsvej 11, DK-2840 Holte, Denmark

(A. An RSL Primer A.1. Types A.1.2. Type Definitions A.1.2.1. Concrete Types)

Example 31 – Net Record Types: Insert Links:

7. To a net one can insert a new link in either of three ways:

- (a) Either the link is connected to two existing hubs — and the insert operation must therefore specify the new link and the identifiers of two existing hubs;
- (b) or the link is connected to one existing hub and to a new hub — and the insert operation must therefore specify the new link, the identifier of an existing hub, and a new hub;
- (c) or the link is connected to two new hubs — and the insert operation must therefore specify the new link and two new hubs.
- (d) From the inserted link one must be able to observe identifier of respective hubs.

8. From a net one can remove a link.³ The removal command specifies a link identifier.

³– provided that what remains is still a proper net

March 2, 2010, 16:48, Vienna Lectures, April 2010

© Dines Bjørner 2010, Fredsvej 11, DK-2840 Holte, Denmark

(A. An RSL Primer A.1. Types A.1.2. Type Definitions A.1.2.1. Concrete Types)

A.1.2.2. Subtypes

- In RSL, each type represents a set of values. Such a set can be delimited by means of predicates.
- The set of values **b** which have type **B** and which satisfy the predicate \mathcal{P} , constitute the subtype **A**:

type

$$A = \{ \mid b:B \cdot \mathcal{P}(b) \mid \}$$

March 2, 2010, 16:48, Vienna Lectures, April 2010

© Dines Bjørner 2010, Fredsvej 11, DK-2840 Holte, Denmark

Example 32 – Net Subtypes:

- In Example 30 on page 173 we gave three examples.
 - For the first we gave an example, **Sorts + Observers + Axioms**, “purely” in terms of sets, see *Sorts — Abstract Types* below.
 - For the second and third we gave concrete types in terms of Cartesians and Maps.

type

[sorts] N', H, L, HI, LI
 $N = \{ |n:N' \cdot wf_N(n)| \}$

value

$wf_N: N' \rightarrow \mathbf{Bool}$
 $wf_N(n) \equiv$
 $\forall n:N \cdot \mathbf{card} \omega Hs(n) \geq 2 \wedge \mathbf{card} \omega Ls(n) \geq 1 \wedge$
 [5–8] of example 1

- In the **Sorts + Observers + Axioms** part of Example 30
 - a net was defined as a sort, and so were its hubs, links, hub identifiers and link identifiers;
 - axioms – making use of appropriate observer functions - make up the wellformedness condition on such nets.

We now redefine this as follows:

- In the **Cartesians + Wellformedness** part of Example 30
 - a net was a Cartesian of a set of hubs and a set of links
 - with the wellformedness that there were at least two hubs and at least one link
 - and that these were connected appropriately (treated as ...).

We now redefine this as follows:

type

$N' = \mathbf{H\text{-set}} \times \mathbf{L\text{-set}}$
 $N = \{ |n:N' \cdot wf_N(n)| \}$

(A. An RSL Primer A.1. Types A.1.2. Type Definitions A.1.2.2. Subtypes)

- In the **Cartesians + Maps + Wellformedness** part of Example 30

- a net was a triple of hubs, links and a graph,
- each with their wellformedness predicates.

We now redefine this as follows:

(A. An RSL Primer A.1. Types A.1.2. Type Definitions A.1.2.3. Sorts — Abstract Types)

A.1.2.3. Sorts — Abstract Types

- Types can be (abstract) sorts
- in which case their structure is not specified:

type

A, B, ..., C

(A. An RSL Primer A.1. Types A.1.2. Type Definitions A.1.2.2. Subtypes)

type

[sorts] L, H, LI, HI

$N' = \text{HUBS} \times \text{LINKS} \times \text{GRAPH}$

$N = \{ |(hs, ls, g): N' \cdot \text{wf_HUBS}(hs) \wedge \text{wf_LINKS}(ls) \wedge \text{wf_GRAPH}(g)(hs, ls) | \}$

$\text{HUBS}' = \text{HI} \xrightarrow{\overline{m}'} \text{H}$

$\text{HUBS} = \{ |hs: \text{HUBS}' \cdot \text{wf_HUBS}(hs) | \}$

$\text{LINKS}' = \text{LI} \rightarrow \text{L}$

$\text{LINKS} = \{ |ls: \text{LINKS}' \cdot \text{wf_LINKS}(ls) | \}$

$\text{GRAPH}' = \text{HI} \xrightarrow{\overline{m}'} (\text{LI} \xrightarrow{\overline{m}'} \text{HI})$

$\text{GRAPH} = \{ |g: \text{GRAPH}' \cdot \text{wf_GRAPH}(g) | \}$

value

$\text{wf_GRAPH}: \text{GRAPH}' \rightarrow (\text{HUBS} \times \text{LINKS}) \rightarrow \text{Bool}$

$\text{wf_GRAPH}(g)(hs, ls) \equiv \text{wf_N}(hs, ls, g)$

- Example 39 on page 233 presents a definition of wf_GRAPH .

■ End of Example 32

(A. An RSL Primer A.1. Types A.1.2. Type Definitions A.1.2.3. Sorts — Abstract Types)

Example 33 – Net Sorts:

- In formula lines of Examples 30–32
- we have indicated those **type** clauses which define *sorts*,
- by bracketed [sorts] literals.

■ End of Example 33

(A. [An RSL Primer](#) A.1. [Types](#) A.1.2. [Type Definitions](#) A.1.2.3. [Sorts](#) — [Abstract Types](#))

End of Lecture 6: RSL: TYPES
